
Help with Internal Server Error 500

Posted by admin - 2009/09/11 01:10

When running HyBing scripts, sometimes, you will see "Internal Server Error 500". This error usually indicates an problem in file permissions.

To fix the permission issue, please set the permissions of all relevant files and folders to 755. Many of the FTP programs allow you to change the permissions for files and folders on the web server.
